

Print mark reader

to
BS Rotary 550 die-cutters

BOGRAMA
next level die-cutting

For consistent cutting accuracy with digital print products

A print mark reader can be used if the print image deviates from the leading edge of the sheet. It reads the position of the print mark and corrects in running direction. Register differences can thus be eliminated.

Printed sheet with print mark.

The printed sheet passes the sensor.

The sensor has detected the printmark, possible differences are compensated.

Benefits:

- Sheet alignment in running direction
- Differences in digital printing are constantly being corrected
- No register differences
- Can be retrofitted at any time
