

Dynamic side alignment

to
BSR 550 Servo die-cutter

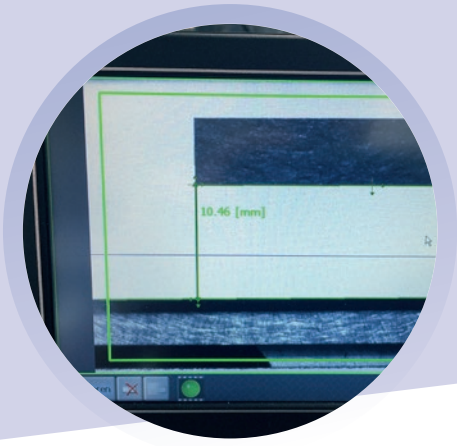

BOGRAMA
next level die-cutting

For consistent die-cutting accuracy, also with digitally printed sheets

The camera system measures the distances between the sheet edge and the print mark on each individual sheet. The dynamic side alignment corrects the determined differences.

The differences determined by the camera are transmitted to the controller.

The display shows the position of the print mark.

Printed sheet with print mark.

Benefits:

- Lateral alignment of printed sheets
- Differences in digital printing are constantly being corrected
- No register differences
- Can be retrofitted at any time
